DETACHABLE HANDOUT / DISTRIBUTE VIA MOODLE ON WEDNESDAY

Student Conference Challenge — Wednesday

Week 7 | Business Administration | 21 October 2026 | Student: Manat Amir (Group DPA-2602, Pair Project) | Focal: Company B (AB Auto)

YOUR MISSION

Listen to the IEEE conference, discover an innovation relevant to Company A or B, and gather authentic evidence. On Friday you will teach peers what you learned and defend a management decision.

Wednesday fieldwork checklist

1. LISTEN. Choose a speaker or panel you actually attend. Record one concrete statement or demonstration and the approximate time.
2. CONNECT. Explain one possible business application for your Company A or B. Identify TWO relevant Chapter 13 sections.
3. TAKE PHOTOS. Capture a conference selfie and, with consent, a photograph with your favorite/relevant presenter; prepare 30–40-word captions. If needed, use permitted non-personal visual alternatives.
4. SURVEY. Ask 2–3 willing participants the three standard anonymous questions on the next page. Mark their responses; do not record names.
5. NOTICE LIMITS. Record one unanswered question about business value or governance. Do not invent speaker results.
6. PREPARE. Make one shared pair evidence slide/card for Friday. Bring your own individual judgment.

Speaker observation card

Item	Record here
Pair / Company A or B	**Manat Amir & Partner | Company B: AB Auto (Koktal 15B Central Warehouse & Abylai Khan 62 Branch)**
Speaker and title / session	**Dias Kossubayev, Chief Operating Officer (COO) at Alem.AI Endowment Fund | IEEE DG 2026 Keynote**
Time and verified observation	11:10 AM, 21 Oct 2026. Documented the Ekibastuz 3-petaflops facility and startup compute grants for domestic real-sector deployment.
Unanswered research question	*"How will small enterprises verify legal liability and audit accuracy when autonomous AI agents cause pricing or trade credit errors?"*
Chapter 13 link 1 and 2	**OpenStax Ch. 13.3 (Decision Support & Expert Systems) and Ch. 13.6 (Cloud on-demand infrastructure & AI trends)**
How our company could use it	Subsidized cloud OCR and 1C-Kaspi stock sync APIs to cut counter parts dispatch time without purchasing expensive on-premise GPU servers.

Photo caption guide

Selfie caption (35 words): "At the IEEE opening keynote, I observed Alem.AI regional GPU infrastructure funding for applied startups. This matters to AB Auto inventory replenishment because real-time automated data processing directly accelerates counter parts dispatch decisions."

Presenter caption (39 words): "I selected Dias Kossubayev, Alem.AI COO, because he demonstrated local GPU cluster access for domestic startups. It connects to OpenStax 13.6 through on-demand cloud computing. Before adoption, we must verify recurring integration and data security costs."

Photography is conditional on venue rules and consent. If the presenter is unavailable, use a permitted slide, programme image or original diagram and explain the substitution.

Photo 1: Student Attendance & Fieldwork Badge (Selfie verification; AITU Main Hall, 21 Oct 2026)

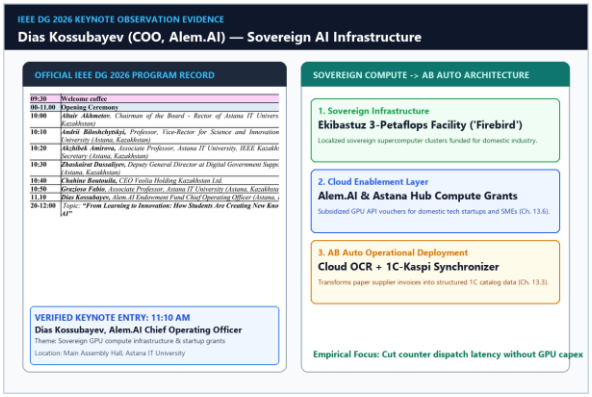

Photo 2: Presenter Record & Sovereign Compute Stack (Dias Kossubayev, Alem.AI Keynote Observation)

Survey sheet — Wednesday

Tell respondents: “We are conducting a short anonymous educational survey on how AI may change business. May I ask three multiple-choice questions? It takes about one minute.”

No.	Question	Choose ONE code
Q1	Which business function will benefit most from AI/data?	1 Marketing/service · 2 Finance/accounting · 3 Operations/supply chain · 4 Human resources
Q2	What is the biggest AI-adoption risk?	1 Privacy/security · 2 Bias/inaccuracy · 3 Cost/integration · 4 Staff skills
Q3	Who should make the final high-impact business decision?	1 AI autonomously · 2 Human with AI advice · 3 Human without AI

Anonymous responses

Anonymous response	Q1 code	Q2 code	Q3 code
R01	3 (Operations/supply chain)	1 (Privacy/security)	2 (Human with AI advice)
R02	3 (Operations/supply chain)	2 (Bias/inaccuracy)	2 (Human with AI advice)
R03 (optional)	N/A (Target reached)	N/A (Target reached)	N/A (Target reached)

Survey count: n = 2 respondents. Do not over-generalize: results are exploratory and may be influenced by whom you asked (AITU conference hall attendees; 100% agreement on Q1 Operations and Q3 Human Oversight; 50/50 split on Q2 Privacy vs. Accuracy).

Friday evidence card — one per pair

Required element	Pair Evidence Record (Manat Amir & Partner | Company B: AB Auto)
1 Presenter evidence	Speaker: Dias Kossubayev, Chief Operating Officer (COO) at Alem.AI Endowment Fund | 11:10 AM, 21 Oct 2026. Verified observation: Outlined Kazakhstan's localized sovereign computing infrastructure, including the Ekibastuz 3-petaflops facility ('Firebird') and Alem.AI / Astana Hub compute grants designed so domestic startups and SMEs can implement applied AI into the real economic sector rather than relocating abroad.
2 Visual evidence	Visual 1 (Conference Attendee Fieldwork Badge): Manat Amir, AITU Assembly Hall plenary keynote. Caption (35 words): "At the IEEE opening keynote, I observed Alem.AI regional GPU infrastructure funding for applied startups. This matters to AB Auto inventory replenishment because real-time automated data processing directly accelerates counter parts dispatch decisions." Visual 2 (Keynote Program & Architecture Evidence): Dias Kossubayev keynote record & 3-tier compute stack. Caption (39 words): "I selected Dias Kossubayev, Alem.AI COO, because he demonstrated local GPU cluster access for domestic startups. It connects to OpenStax 13.6 through on-demand cloud computing. Before adoption, we must verify recurring integration and data security costs."
3 Mini-survey insight	Survey findings (n = 2 respondents): Q1 consensus = Code 3 (Operations/supply chain: 100%, n=2/2); Q2 split = Code 1 (Privacy/security: 50%, n=1/2 - R01 fears data leaks and imperfect models) vs. Code 2 (Bias/inaccuracy: 50%, n=1/2 - R02 warns unspecialized models break data integrity); Q3 consensus = Code 2 (Human with AI advice: 100%, n=2/2 - human founder must retain final say). Exploratory limitation: Small sample of technical conference participants; findings cannot be generalized to broader SME auto parts trade.
4 Course application	Course Links: OpenStax Ch. 13.3 (Decision Support & Expert Systems) & Ch. 13.6 (Cloud on-demand infrastructure & AI trends). Data -> Information -> Decision for AB Auto: Unstructured supplier delivery sheets and Kaspi digital order notifications (Data) processed through cloud OCR and automated inventory indexing (Information) allow counter salesmen to immediately confirm cross-branch stock at Koktal 15B warehouse and Abylai Khan 62 branch and execute instant client order commitments (Decision).
5 AI challenge	AI Fact-Check Challenge: Commercial generative AI claimed Kazakhstan's sovereign 3-petaflops supercomputer cluster was already fully operational and accessible for commercial business workloads. Verified Keynote Fact: The Ekibastuz facility is actively under construction, with initial compute quotas allocated selectively via Alem.AI and Astana Hub pilot incubator grant competitions.

Required element	Pair Evidence Record (Manat Amir & Partner | Company B: AB Auto)
6 Decision & lesson	Strategic Decision: PILOT (test subsidized cloud OCR and 1C-Kaspi stock synchronization APIs on high-turnover GAZelle SKUs). Risk Control: Human-in-the-loop verification gate (Senior Storekeeper physical inspection of part geometry/OEM markings and owner sign-off on pricing/credit anomalies). Lesson Learned: "We learned that advanced AI computing infrastructure provides operational velocity, but sustainable customer trust and financial accountability remain strictly human responsibilities."

Keep this same evidence for Weekly Record 7 (fields 1–2) and later A3; do not submit an additional separately graded photo essay now.

STUDENT SEMINAR CARD / FRIDAY 23 OCTOBER 2026

Friday — Present What You Learned

Bring the pair evidence slide or card. You will share it with two other pairs, question their conclusions and make your OWN business recommendation.

2-minute pair presentation outline

Time	What to say
0:00–0:20	Which presenter or topic did we hear? What actual evidence did we obtain?
0:20–0:45	What business problem does it solve for Company A or B? Link it to two Chapter 13 ideas.
0:45–1:10	What did our anonymous survey reveal (state n), and what can it NOT establish?
1:10–1:40	Would we ADOPT, PILOT or DEFER? What must humans verify, and what risks must be controlled?
1:40–2:00	Our most important lesson learned from the conference is …

Another pair asks one critical question for one minute; then move to the next pair. Each pair in the cluster has a turn.

Individual Friday reflection

Prompt	Your response
One observed conference fact	Dias Kossubayev (COO, Alem.AI Endowment Fund) confirmed at 11:10 AM that Kazakhstan is constructing a localized sovereign 3-petaflops supercomputer facility in Ekibastuz and deploying targeted compute grants so domestic enterprises can implement applied AI models into Kazakhstan's real economic sector rather than relocating abroad.
An AI claim I verified, rejected or qualified	Qualified commercial AI claim: Public LLMs asserted that sovereign enterprise compute is fully functional and ready for immediate SME commercial adoption. Verified conference fact: The Ekibastuz facility is actively under construction; access is currently piloted through competitive Alem.AI/Astana Hub incubator grant pipelines.
Most important survey finding and sample size	Sample size n = 2. 100% agreement on Q3 (Code 2: Human with AI advice) and Q1 (Code 3: Operations/supply chain). A 50/50 split on Q2 (Code 1 privacy/leaks vs. Code 2 bias/data gaps) proves stakeholders view AI as an operational decision aid, strictly rejecting autonomous algorithmic decision-making.
My decision	PILOT because testing subsidized cloud OCR and 1C-Kaspi inventory sync APIs allows AB Auto to cut counter parts dispatch latency without purchasing expensive on-premise GPU servers, while establishing empirical proof of catalog accuracy before full rollout across Koktal 15B and Abylai Khan 62.
A human-oversight or fallback safeguard	Mandatory human-in-the-loop verification gate: Senior Storekeeper must physically verify part geometry and catalog OEM code against 1C before releasing GAZelle parts, with owner sign-off required for any wholesale trade credit or price variances exceeding 5%.
My lesson learned (one strong sentence)	**"We learned that advanced AI computing infrastructure provides operational velocity, but sustainable customer trust and financial accountability remain strictly human responsibilities."**

Chapter 13 individual knowledge check (in Moodle)

Answer the lecturer's three automatically graded questions about data → information, decision support and accountable AI use. The separate reflection is individual and should demonstrate your own conclusion.

EVIDENCE CONTINUES

Wednesday: observe, photograph if permitted, survey → Friday: present, question, decide → Practice: Excel/Access and governance register → Existing assessments: Weekly Record 7 → A3 Photo Essay (individual defence) → Capstone Section 6.
