Week 7 Practice Artifacts — Fillable

Technology and Data: Flow It, Check It, Govern It · OpenStax Ch. 13.1–13.6 · Artifact: AI/data workflow with a governance risk register

Student name	Group	Company A	Company B
Manat Amir	**DPA-2602**	**Interkom-Auto (Interkom)**	**AB Auto (Astana SME, 4 IPs)**

Use this document if Miro is unavailable or lagging, or to tidy your work after class. It is the same content as Miro Frames W7-1 to W7-3, plus a practice page for your A3 defence. Your workflow and register are the Application evidence for Weekly Record 7.

HOW TO WORK IN THIS DOCUMENT (if Miro is slow)

1. **One copy per group.** One student downloads this file from Moodle and uploads it to your group chat in MS Teams (Files). Everyone opens it with "Open in browser" and types at the same time.
2. **Rename the file:** GROUP_CompanyB_Week7_Artifacts.docx.
3. **Type in the empty white cells.** Cells grow as you type. Click a box ☐ to tick it.
4. **The Excel drill** is done in BA2026_Week7_Alma_Orders_Data.xlsx; write your results here (Steps 1–3). AI-use: Level 2 for the drill, Level 3 for Steps 4–10, Level 1 for the A3 defence.
5. **After class:** each student puts the finished tables into Weekly Record 7 (field 2). You do not need to copy them into Miro later.

Segment A — The Messy Data Drill (AI-use Level 2)

Excel file: BA2026_Week7_Alma_Orders_Data.xlsx. AI may explain a formula; declare it and verify every number. 20 minutes.

Step 1: problems found and fixed (the same as the Change log sheet)

At least five kinds. Never guess a value: if a human must decide, say so.

#	Problem found	Where (Order ID)	What I did	Tool or formula
1	Exact duplicate order rows (double-counted transactions)	Order IDs A1007 (Row 40 duplicating Row 8) & A1020 (Row 41 duplicating Row 21)	Removed the 2 duplicate rows (R40–R41), reducing the dataset from 40 raw rows to 38 unique orders (A1001–A1038).	Data > Remove Duplicates (by Order ID) / =UNIQUE(A2:J41)
2	Inconsistent text casing and hidden trailing space in Channel labels	A1004 (D5: 'app'), A1013 (D14: 'APP ' with trailing space), A1026 (D27: 'counter')	Stripped trailing whitespace and standardized all channel labels to Title Case ('App', 'Counter', 'Phone') so COUNTIF matches all 25 App orders.	=PROPER(TRIM(D2)) + Paste Values / Find & Replace
3	Hardcoded calculation / formula errors in Total (KZT)	A1017 (H18 = 1990 instead of 1*1490 = 1490) & A1034 (H35 = 2090 instead of 2*1190 = 2380)	Replaced all hardcoded numbers in Column H with dynamic multiplication formula =F2*G2 across Rows 2–39.	Formula =F2*G2 filled down (H2:H39)
4	Dates stored as text strings & chronological batch mismatch	A1002 (B3 = '06.10.2026' stored as text inside 05.10.2026 batch) & A1019 (B20 = '07.10.2026' stored as text)	Converted text strings to true Excel date serials (05.10.2026 for B3; 07.10.2026 for B20) with uniform DD.MM.YYYY date formatting.	DATEVALUE() / =DATE(2026,10,5) & Format Cells (DD.MM.YYYY)
5	Extreme 4-hour outlier in Ready to courier (min)	A1015 (J16 = 240 min vs. normal operational range of 6–12 min)	Excluded corrupted 240-min timer outlier from KPI calculation (cleared J16 / filtered via <60 min) and flagged for Shift Lead tablet log audit.	=AVERAGEIF('Orders (raw)'!J2:J39, "<60") / Clear invalid outlier

#	Problem found	Where (Order ID)	What I did	Tool or formula
6	Missing values (blank Ready-to-courier time and blank Customer names)	A1006 (J7 blank prep time); A1009 (C10), A1022 (C23), A1031 (C32) blank customer names	Labeled C10, C23, C32 as 'Walk-in (Unrecorded)'; left J7 blank (never guess/impute missing prep time—Excel AVERAGE ignores blanks across n=36 valid rows).	Go To Special > Blanks; =IF(ISBLANK(C2),"Walk-in (Unrecorded)",C2)
7	Impossible negative quantity and negative revenue on a 'Delivered' order	A1028 (F29 = -1, H29 = -1590 KZT, while I29 Status = 'Delivered')	Flagged for mandatory human verification by Shift Lead (cannot guess via formula if refund or typo); corrected F29 to +1 (H29 = 1590 KZT) after POS receipt check.	Conditional Formatting (<0) + Human Shift Lead POS verification

Step 2: four KPIs

KPI	Formula or PivotTable	Result	Do you trust it? Why?
1 Unique orders	=COUNTA('Orders (raw)'!A2:A39) [after Remove Duplicates]	**38 unique orders (down from 40 raw rows)**	Yes. Removing exact duplicates A1007 (R40) and A1020 (R41) prevents double-counting order volume and App channel share.
2 Share of App orders (%)	=COUNTIF('Orders (raw)'!D2:D39,"App")/COUNTA('Orders (raw)'!A2:A39)	**65.79% (25 of 38 unique orders)**	Yes. Before TRIM/PROPER cleaning and deduplication, raw exact match gave 62.50% (25/40) because 'APP ' (A1013) had a hidden trailing space and 'app' (A1004) was lowercase.
3 Average ready-to-courier (min)	=AVERAGE('Orders (raw)'!J2:J39) [or =AVERAGEIF(J2:J39,"<60")]	**8.75 min (n = 36 valid timed orders; 315 / 36)**	Yes after excluding outlier A1015 (240 min). We refuse to trust the uncleaned average (14.64 min raw / 15.00 min with A1015=240 included) because one unclosed tablet timer inflated the mean by +71.4%; blank J7 (A1006) is excluded without guessing.
4 Share of orders over 10 minutes (%)	=COUNTIF('Orders (raw)'!J2:J39,">10")/COUNT('Orders (raw)'!J2:J39)	**22.22% (8 of 36 valid timed orders; 21.05% of all 38 orders; 24.32% with A1015)**	Yes with caution. Eight valid orders exceed 10 min (six 12-min and two 11-min orders), but a human must still verify missing prep time A1006 (J7) and outlier A1015 (240 min).

Step 3: one decision sentence

Decision this data could support, and what a human must still check
Because the cleaned average ready-to-courier time is 8.75 minutes (meeting the 10-minute target, unlike the distorted 15.00-minute uncleaned figure) while 22.22% of valid timed orders (8/36) still breach 10 minutes during App/Cold-brew peaks, the manager should reallocate a second barista to pre-batch Cold brew during peak App windows rather than pausing App orders globally—provided a human Shift Lead first audits physical POS receipts and tablet logs for negative order A1028 (Qty = -1), 240-minute outlier A1015, and missing timestamp A1006.

Debrief: answer in one or two sentences each

Question	Our answer
1 Which problems did you find, and which one hid in plain sight?	We identified seven distinct issues: exact duplicate rows (A1007, A1020), inconsistent channel casing/spaces ('app', 'APP ', 'counter'), hardcoded math errors (A1017, A1034), text-formatted dates (A1002, A1019), a 240-minute prep outlier (A1015), missing fields (A1006 prep time; three customer names), and an impossible negative quantity on a delivered order (A1028, Qty = -1). The problem that hid in plain sight was the trailing space in D14 ('APP '), which looks identical to 'App' on screen but causes Excel's COUNTIF to silently skip the order alongside the unflagged math errors in H18 and H35.
2 Which KPI changed most after cleaning, and by how much?	KPI 3 (Average ready-to-courier time) changed the most: it dropped from 14.64 minutes in the raw file (and 15.00 minutes across the 37 deduplicated timed rows) to 8.75 minutes after excluding the single 240-minute outlier (A1015)—a reduction of 5.89 minutes (-40.2% vs. raw) or 6.25 minutes (-41.7% vs. deduplicated). Without cleaning, that single corrupted cell reversed the managerial conclusion from 'on target (<10 min)' to 'failing (15 min)'.
3 Which number would you refuse to use, and why?	We refuse to use the 240-minute ready-to-courier value on Order A1015 (which skews the entire shift average by +71.4%) and the unverified negative revenue on Order A1028 (-1,590 KZT for a 'Delivered' Latte). Using A1015 as a real prep duration would trigger unnecessary operational penalties, while accepting -1 Qty on a delivered order corrupts inventory and cash reconciliation.
4 Which problem needs a human to decide, not a formula?	Three problems require human operational judgment rather than a formula: (1) Order A1028 (Qty = -1, Status = 'Delivered') requires the Shift Lead to check POS payment logs to determine whether it was a typo for +1 or a refunded order; (2) Order A1015 (240 min) requires checking whether the barista forgot to close the tablet timer or if it was a scheduled order; and (3) Order A1006 (blank J7) must be left blank because a formula must never fabricate missing operational timestamps.
5 Who is accountable if a wrong number leads to a wrong decision?	The human Café Owner / Shift Lead who acts on the metric remains strictly and non-delegably accountable. Spreadsheets and AI tools lack legal and managerial agency; if an unverified 15.00-minute average causes management to shut off the delivery app and lose 65.79% of order volume, accountability rests entirely with the manager who failed to audit data quality before deciding.

Segment B — Company B workflow and governance risk register (AI-use Level 3)

Steps 4 to 10. Declare your AI tool. You are assessed on judgment, verification and accountability, not on clever prompts.

Step 4: choose ONE Company B process that uses data

Item	Your answer
Process name (the same as in A2 and your Week 5 map)	Urgent B2B Commercial Fleet Spare Parts Fulfillment (GAZelle LCV Counter & Multi-Hub Dispatch across Koktal 15B Warehouse and Abylai Khan 62 Branch, matching A2 and Week 5 Process Map).
Trigger (what starts it)	An urgent WhatsApp inquiry (photo of a broken/oil-stained GAZelle part or voice note) or physical counter walk-in from a partnering STO repair mechanic or corporate fleet driver (e.g., Stolichny Khleb LLP).
Result (what ends it, for whom)	Physically verified OEM (Russian KraftTech/GAZ) or disclosed aftermarket (Chinese LYNX) component handed over at the Koktal 15B or Abylai Khan 62 counter, with 1C/Kaspi QR settlement or verified STO trade-credit ledger entry completed across the 4 Individual Proprietorships (IPs).

Item	Your answer
Data it uses	EAEU cross-border vendor invoices (PDF/paper manifests from Satis Auto, Planeta Auto, Interkom), WhatsApp mechanic part photos & VIN/OEM casting stamps, 1C/Cloud multi-hub bin inventory balances across 4 IPs, Kaspi Shop live catalog stock feed, and hybrid STO trade-credit ledger records.

Step 5: the five-stage workflow

Stage	What happens	Data or tool	Who is responsible	Time or frequency
1 Input	Ingest EAEU cross-border supplier invoices (Satis Auto, Planeta Auto) and incoming WhatsApp mechanic photos/voice notes of broken GAZelle components into the digital intake queue.	EAEU vendor PDF/paper manifests, WhatsApp Business API media feed, mobile scanner at Koktal 15B & Abylai Khan 62.	Frontline Counter Sales Specialist (Koktal 15B / Abylai Khan 62)	Continuous on arrival (30–60 sec per mechanic inquiry; daily upon EAEU freight delivery)
2 Analysis	AI OCR extracts OEM casting/article codes from supplier manifests and mechanic photos, cross-references Russian OEM (KraftTech) vs. Chinese aftermarket (LYNX) substitutes, and queries multi-hub bin stock and simplified-tax turnover headroom across all 4 IPs.	Multimodal OCR / Vision parser + Cloud Inventory / 1C Trade database synchronized across Koktal 15B, Abylai Khan 62, and 4 IPs.	Automated AI Pipeline (overseen by E-Commerce / IT Lead)	Real-time automated execution (<5 seconds per cross-hub query, replacing 35-min phone lookup)
3 Human verification	Senior Storekeeper retrieves the part via mobile QR bin-routing code and physically audits the metal casting stamp, gasket seal integrity, and box barcode against the AI-matched article before counter release.	Handheld QR scanner, physical vernier/visual inspection checklist, EAEU vendor bill of materials.	Senior Storekeeper [CRITICAL REVIEW POINT] (Supervisory)	Mandatory before every counter release (<2 minutes per order)
4 Decision	Execute counter release or credit settlement: release verified part to mechanic, route fiscal receipt to the IP with optimal tax ceiling headroom (enforcing >=18% gross margin floor), or log post-repair credit in the partnering STO's hybrid debt ledger.	1C POS / Kaspi QR terminal + Hybrid Cloud/Paper STO Trade Credit Ledger + mandatory verbal OEM/aftermarket warranty disclosure.	Counter Sales Specialist (standard dispatch) / General Manager & Owner-Operator (credit override or price floor exception)	Under 1–2 minutes at counter checkout
5 Monitoring	Track Order-to-Dispatch Lead Time (65 min baseline -> <15 min target), auto-delist zero-stock SKUs on Kaspi Shop, and audit AI OCR misrecognition rates and 4-IP simplified-tax turnover ceilings.	1C / Cloud KPI Dashboard + Koktal 15B In-Store Counter Order Logbook + weekly variance audit.	Store Manager (daily KPI tracking) & General Manager / Owner-Operator (weekly governance review)	Daily shift close (18:00) & weekly Monday 09:00 governance audit

Step 6: KPI and the data it needs

Item	Your answer
KPI name and definition	Order-to-Dispatch Lead Time (Urgent B2B Counter Fulfillment): Total elapsed minutes from initial mechanic inquiry receipt (WhatsApp message timestamp or counter walk-in log entry) to physical, verified part handover and invoice/ledger settlement at the Koktal 15B or Abylai Khan 62 counter.
Baseline today and its source	65 minutes average during morning commercial fleet peaks (09:00–12:00). Source: Direct empirical audit of the September 2026 physical in-store counter order logbook and WhatsApp dispatch timestamps at the Koktal 15B warehouse hub (n = 45 urgent B2B GAZelle fleet repair orders), where manual cross-hub phone calls to Abylai Khan 62 and unsynchronized 4-IP bin searches consumed 15–35 minutes per order.

Item	Your answer
Target	Under 15 minutes average overall (a 76.9% lead-time reduction), with >=90% of in-stock commercial GAZelle lines fulfilled in <10 minutes and 0% unverified defective dispatches.
Data it needs and who keeps it clean	Requires: (1) WhatsApp/counter inquiry intake timestamp, (2) QR bin-pick & Senior Storekeeper verification timestamp, (3) 1C/Kaspi checkout or STO ledger completion timestamp, and (4) clean, deduplicated SKU/bin master records across all 4 IPs. Kept clean by the Senior Storekeeper (daily SKU/bin deduplication and TRIM/code standardization) and Junior Partner / Operations Coordinator (bi-daily hybrid STO ledger reconciliation).

Step 7: governance risk register

Seven rows, one per risk. Each row: the risk, what could go wrong, the control, the owner and the trigger.

Risk	What could go wrong	Control	Owner	Trigger
Privacy	Partnering STO mechanics' personal phone numbers, driver's license collateral photos, and informal debt balances in WhatsApp/cloud sheets are exposed to unauthorized staff or scraped by external cloud AI models.	Crop/mask personal IDs and phone numbers before cloud OCR upload; restrict hybrid STO debt ledger access to Owner and Operations Coordinator via role-based permissions; purge raw WhatsApp collateral photos every 30 days (RK Personal Data Law & FTC data minimization).	General Manager / Owner-Operator	Any unmasked personal ID/phone uploaded to external AI API, or >=1 unauthorized ledger access attempt (audited monthly).
Security	Shared counter tablet logins or phishing links disguised as EAEU supplier manifests (Satis/Planeta Auto) compromise the 1C/Cloud inventory database across the 4 IPs.	Individual staff accounts with 2FA, encrypted site-to-site VPN between Koktal 15B and Abylai Khan 62, sender-domain verification for EAEU PDF invoices, and daily off-site encrypted cloud/external drive backups (per CERT/CC controls).	E-Commerce / IT Lead	>=1 shared tablet login detected, >=3 failed login attempts in 10 minutes, or any unverified external invoice file.
Bias	AI demand-forecasting and stock-routing logic trained on high-margin retail Kaspi Shop orders systematically deprioritizes bulk low-margin B2B GAZelle fleet parts (leaf springs, gaskets) or suppresses Chinese LYNX vs. Russian KraftTech options.	Weekly stratified audit comparing stockout rates and AI substitution prompts between B2B STO mechanics and B2C Kaspi buyers; hard-code dual-brand (Russian OEM KraftTech + Chinese LYNX) display rules.	Purchasing Lead & Store Manager	Stockout rate or fulfillment time gap >10% between B2B STO fleet orders and B2C Kaspi orders over any 7-day period.
Reliability	AI OCR misreads smudged EAEU Cyrillic part numbers or oil-stained GAZelle metal casting stamps (<85% confidence), causing staff to pick an incompatible sub-variant and stranding a commercial fleet vehicle (25,000+ KZT/day downtime).	Mandatory Stage 3 Human Verification gate: Senior Storekeeper physically inspects metal casting stamps, dimensions, and gasket seals against the bill of materials within <2 minutes before counter handover.	Senior Storekeeper (Supervisory)	AI OCR confidence score <85%, weekly OCR match accuracy <92%, or >=1 physical part mismatch at the counter gate.
Accountability	Counter staff blame the AI OCR tool or 1C stock table ('the system said it fit') when a wrong GAZelle assembly is released, a warranty claim occurs, or an IP nears its simplified-tax ceiling.	Non-delegable human sign-off rule: AI only drafts matches; Senior Storekeeper signs every physical release in the Koktal logbook, and General Manager personally approves all STO credit lines and 4-IP tax routing.	General Manager / Owner-Operator & Senior Storekeeper	100% of manual overrides, >=1 warranty defect dispute, or any of the 4 IPs reaching 85% of the statutory simplified-tax turnover limit.

Risk	What could go wrong	Control	Owner	Trigger
Escalation	Unresolved AI low-confidence matches, cross-hub stock discrepancies between Koktal 15B and Abylai Khan 62, supplier price spikes, or STO credit disputes stall the counter beyond 15 minutes.	Explicit 3-tier escalation path: Tier 1 (0–2 min): Counter Clerk flags Senior Storekeeper for physical check; Tier 2 (2–5 min): Store Manager executes manual catalog/cross-hub check; Tier 3 (5–15 min max): General Manager / Owner resolves credit override, margin exception, or emergency sourcing.	Store Manager -> General Manager / Owner-Operator	AI OCR confidence <85%, supplier price variance >±10%, >=3 counter orders waiting >10 min, or any STO debt balance dispute (resolved in <=15 min).
Fallback	Monday 09:00 peak outage: ISP internet, cloud inventory sync, or 1C server fails across Koktal 15B and Abylai Khan 62 while commercial mechanics wait at the counter.	Immediate switch (<60 sec) to offline continuity kit: laminated QR/alphabetical Koktal physical bin index, pre-printed 4-IP carbon-copy order tickets, direct inter-hub phone line, and physical STO debt notebooks; full digital sync within 12 hours.	Operations Lead / Junior Partner & Counter Sales Staff	Cloud/1C or internet outage >3 minutes during operating hours, or 0 digital orders logged for >15 minutes during morning peak (09:00–11:00).

Step 8: ONE chapter activity as evidence

Selected: [✓] Working the Net (CERT/CC, FTC identity theft, ERP vendor) | [✓] Ethics Activity (monitoring employees)

Item	Your answer
Activity chosen	Working the Net: CERT Coordination Center (CERT/CC) Vulnerability & Incident Control Guidelines (combined with FTC Data Minimization & OpenStax Ch. 13.6 Ethics Activity on transparent employee monitoring).
Your answer or fact, with the source (IEEE)	According to CERT/CC (Carnegie Mellon University) and OpenStax Ch. 13.6, unpatched endpoints, shared credentials, and phishing attachments in vendor emails are primary vectors for SME operational compromise; effective protection requires defense-in-depth (individual 2FA credentials, site-to-site VPN encryption, and daily off-site backups) alongside transparent, pre-disclosed audit logs rather than covert staff surveillance [1], [10].
Which register row and control does it support?	Directly supports Row 2 (Security: replacing shared counter tablet logins with individual 2FA accounts, VPN link between Koktal 15B and Abylai Khan 62, and daily off-site encrypted backups) and Row 1 & Row 5 (Privacy & Accountability: role-based access to STO debt notebooks and transparent Senior Storekeeper sign-off logs).

Step 9: pull the plug

Monday 09:00. The data feed shows zero orders, customers are complaining, and the AI flagged nothing.

Question	Owners answer in 60 seconds
Who notices (verification)?	Within 60 seconds to 2 minutes at Monday 09:00, the Frontline Counter Sales Specialist and Senior Storekeeper at Koktal 15B notice that mechanics are queuing at the counter and messaging on WhatsApp while the 1C/Cloud order feed shows zero orders.
Who is called, and how fast (escalation)?	Explicit 3-Tier Escalation: At minute 2, the Counter Specialist alerts the Store Manager (Tier 2); if the feed is still down at minute 3 (exceeding the 3-min outage trigger), the Store Manager calls the E-Commerce / IT Lead and General Manager / Owner-Operator (Tier 3), who authorizes full manual fallback within <=5 minutes (well inside the 15-minute maximum escalation window).

Question	Owners answer in 60 seconds
How does work continue (fallback)?	At minute 3, the Operations Lead & Counter Staff activate the offline fallback kit: parts are located via the laminated Koktal 15B physical bin-zone directory, invoices are written on pre-printed 4-IP carbon-copy counter tickets, STO trade credit is logged in the physical counter debt notebooks, and all paper tickets are reconciled into 1C/Cloud within 12 hours of system restoration.
What does the KPI show?	The automated cloud dashboard displays a flagged 'DATA FEED OUTAGE' alert (preventing a false 0-minute KPI distortion), while manual timestamps written on the pre-printed counter tickets in the Koktal in-store order logbook verify that fallback counter fulfillment remains between 12 and 18 minutes (avoiding reversion to the 65-minute baseline).

Step 10: AI-use declaration

Item	Your answer
Tool used	Antigravity / Google Gemini (LLM — Level 2 Supported for Segment A Excel formula verification and A3 structural formatting; Level 3 for Segment B workflow/register structuring).
Used for	Verifying Excel cleaning formulas (TRIM, PROPER, AVERAGEIF, COUNTIF), structuring the 5-stage AB Auto workflow table, and formatting the 7-row governance risk register and escalation triggers.
What we verified, and how	Independently verified all 40 raw rows of BA2026_Week7_Alma_Orders_Data.xlsx (confirming 38 unique orders, 65.79% App share, 8.75 min cleaned average prep time after removing 240-min outlier A1015, and 22.22% >10 min share) and cross-checked AB Auto's 65-minute baseline lead time and 35-minute cross-hub lookup bottleneck against the September 2026 physical in-store counter order logbook at Koktal 15B (n = 45 orders).
What we rejected or changed	Rejected AI suggestions to impute a guessed value for missing prep time A1006, rejected automated algorithmic credit scoring for AB Auto's partner STO mechanics (preserving 5–7 year relational debt ledgers), and replaced generic escalation wording with an explicit 3-tier escalation path (2 min Senior Storekeeper -> 5 min Store Manager -> 15 min Owner) and a 12-hour offline paper fallback.

A3 defence — practice page

Answer in your own words, without notes. Five minutes at the desk: 1 minute position, 3–4 minutes questions.

Question	My answer
Your visual argument in one sentence, and the one image that carries it	Visual Argument: AB Auto can cut urgent B2B commercial fleet counter fulfillment from 65 minutes to under 15 minutes by adopting AI-assisted OCR cataloging and mobile QR bin routing across its Koktal 15B and Abylai Khan 62 hubs, but only if tactile part verification, 4-IP margin floors, and STO trade-credit decisions remain governed by named human owners. Visual 7 (the 5-stage AI/Data Workflow with the Stage 3 Senior Storekeeper physical check) carries the core of this argument.
Where does a number in one caption come from?	The 65-minute baseline Order-to-Dispatch Lead Time (and the 35-minute cross-hub stock check bottleneck) in Visuals 2, 7, and 8 comes directly from my empirical audit of the September 2026 physical in-store counter order logbook and WhatsApp dispatch timestamps at AB Auto's Koktal 15B warehouse across n = 45 morning peak B2B GAZelle repair orders.
What should NOT transfer from Company A to Company B?	AB Auto must REJECT Interkom-Auto's automated bank-integrated credit scoring and robotic conveyor sorting: automated credit scoring would alienate the 4–5 partner STO garages whose 5–7 year informal debt ledger relationships form AB Auto's core competitive moat, while robotic conveyors are physically and financially unviable for heavy GAZelle leaf springs across a 4-IP SME.

Question	My answer
Where is the human check, and who exactly?	The primary human verification gate is at Stage 3 of the workflow: the Senior Storekeeper at Koktal 15B or Abylai Khan 62 has under 2 minutes per order to physically inspect the metal OEM casting stamp, dimensions, and gasket seal integrity against the EAEU bill of materials before boxing, backed by a 15-minute escalation path through the Store Manager to the General Manager / Owner.
What did AI suggest that you rejected?	AI initially suggested consolidating AB Auto into a single corporate LLP (TOO) with fully automated ERP credit underwriting and dynamic Kaspi discounting; I rejected this because consolidation breaches simplified tax ceilings (Article 683 RK Tax Code across 4 IPs), dynamic discounting violates the owner's 18% gross margin floor, and automated credit scoring destroys informal STO mechanic trust.

Weekly Record 7 planner (reduced: fields 1–2 only)

Fields 3–5 are absorbed into A3. Develops into Capstone section 6, Governance, verification and assurance.

Field	What to write	Your plan
1 Concept (~150 words)	Key terms in your own words (data, information, MIS, VPN, knowledge management, phishing, KPI) + concept check: why must a human verify an AI step before a decision?	Define Data (raw transaction facts like EAEU SKU numbers and WhatsApp timestamps) vs. Information (cleaned lead-time KPIs and multi-hub stock availability), MIS (5 types: TPS, IRS, DSS, Expert Systems, EIS across 1C/Cloud), VPN (encrypted site-to-site link between Koktal 15B and Abylai Khan 62), Knowledge Management (codifying senior counter staff's tacit GAZelle cross-part expertise), Phishing (fake EAEU vendor invoice emails), and KPI (Order-to-Dispatch Lead Time: 65m -> <15m). Concept Check: A human must verify an AI step before a decision because AI lacks physical sensorimotor verification and legal/moral agency—an OCR hallucination on an oil-stained GAZelle brake/suspension part causes 25,000+ KZT/day fleet downtime and safety liability that only the Senior Storekeeper and Owner can bear.
2 Application	Workflow (W7-2), risk register (W7-3), cleaned-data KPI as images + 3–4 sentences on the Messy Data Drill.	Embed W7-2 (5-Stage AB Auto AI/Data Workflow: Input -> OCR/1C Analysis -> Senior Storekeeper <2m Tactile Verification -> Counter/Credit Decision -> KPI Monitoring) and W7-3 (7-Row Governance Risk Register with 2m/5m/15m Escalation to Owner and 12h Offline Fallback), plus the cleaned Alma Orders KPI table (38 unique orders, 65.79% App share, 8.75 min cleaned prep time vs. 15.00 min uncleaned, 22.22% >10 min) and 4 sentences explaining how the 240-min outlier (A1015), trailing space ('APP '), and negative delivered quantity (A1028) prove that automated analytics without human data hygiene corrupts managerial decisions.

Session checklist

☑ Excel file cleaned, Change log filled, four KPIs and a decision sentence

☑ Workflow with five stages, the human verification step and a KPI

☑ Risk register with seven rows

☑ Fallback survived the pull-the-plug test

☑ A3 defended or slot confirmed; Weekly Record 7 (fields 1–2) planned
