Course: Business Administration (BA 1204) · Academic Year 2026–2027

Assignment 2: Video Essay Script — The Human–AI Operating Model for Company B

Student Name: Manat Amir | Group: DPA-2602 | Attestation Period: 1st Attestation
Company A: Interkom-Auto | Company B: AB Auto (Astana, Kazakhstan)
Word Count: 458 words (excluding title block and reference list)

———

[0:00 – 0:30] Opening Position: For AB Auto, a commercial automotive parts distributor in Astana, artificial intelligence must execute high-volume data matching and inventory visibility, while humans must retain non-delegable accountability for trade credit risks, physical parts verification, and supplier warranty negotiations [1], [3]. AI cannot bear legal or financial liabilities [2]. Therefore, our operating model automates routine cataloging and cutoff triggers, but keeps customer-facing relationships and physical quality gates strictly under human control [3], [4].

[0:30 – 1:15] The Process: To anchor this model, we mapped AB Auto's core operational workflow: the urgent B2B commercial fleet spare parts fulfillment process [1]. Currently, commercial GAZelle fleet mechanics face an average order-to-dispatch lead time of 65 minutes during morning peaks [4]. As shown on our current-state process map, the primary operational bottleneck is Step 3: manually verifying warehouse bin balances and placing phone calls between the Koktal 15B warehouse and the Abylai Khan branch, which consumes up to 35 minutes [4]. Our primary Key Performance Indicator is Order-to-Dispatch Lead Time, targeting a reduction from the 65-minute baseline to under 15 minutes [1].

[1:15 – 2:45] The Allocation: Our redesigned future-state process applies the four task allocation categories from our Week 4 matrix [1], [3]. First, Automated: querying multi-hub

inventory balances and delisting zero-stock lines on Kaspi are fully automated via database triggers, eliminating the stock-check bottleneck instantly [1], [2]. Second, AI Executes with Human Review: supplier invoice intake uses optical character recognition to draft catalog entries, but the Senior Storekeeper must verify cross-codes to prevent catalog corruption [1], [3]. Third, Human + AI: counter clerks utilize multimodal vision tools to match broken vehicle parts, supported by automated credit scoring [3]. Fourth, Human Only: physical staging of heavy mechanical assemblies and negotiating informal debt terms with repair shops remain strictly human [4]. Crucially, our model establishes an explicit human review point: the Senior Storekeeper physically inspects part dimensions and OEM stamps before packaging [1]. Furthermore, if cloud systems fail at Monday 09:00, our manual fallback immediately activates pre-printed bin order sheets and physical credit ledgers, ensuring uninterrupted counter fulfillment with full digital reconciliation within 12 hours [1], [2].

[2:45 – 3:30] Comparison and Transfer: Comparing AB Auto with Company A, Interkom-Auto, reveals distinct institutional trade-offs [2], [4]. Interkom uses automated robotic warehouse sorting and centralized bank-integrated credit algorithms [4]. We adopt Interkom's automated API inventory triggers and adapt their invoice OCR pipeline [1], [2]. However, we explicitly reject their automated credit underwriting and conveyor automation [4]. In Astana, AB Auto's primary competitive moat is informal trust and debt ledgers with local fleet mechanics; replacing this with rigid automated scoring would destroy customer retention [4].

[3:30 – 4:00] Close: Company B must immediately deploy cloud inventory synchronization across its Koktal and Abylai Khan hubs with mobile barcode lookup [1]. Success will be demonstrated when morning counter fulfillment drops below 15 minutes while maintaining a zero-stockout rate on top commercial GAZelle SKUs [1], [4].
